## COTONEASTERS

The Cotoneasters with deciduous leaves discovered by Wilson in Western China now form one of the interesting groups in the Arboretum, and among them are some of the handsomest shrubs of recent introduction, suitable for decoration of northern gardens. Several of them are plants of exceptionally good habit with gracefully arching branches; the leaves on the different species vary in size, color and texture, and on several of the species assume brilliant autumn colors; the flowers are small in small clusters, but are produced in the greatest profusion, and in autumn the branches are covered with red or black fruits. The flowering time of these plants extends through several weeks; and Cotoneaster-fruits enliven the collection from September to December (A. A. Bull. No. 6, P. 21-22-May 23, 1921.)

## THE BEST HEDGE PRIVETS

The California Privet is not *permanently hardy* in New England nor in fact is it perfectly safe North of Washington. The Ibolium Privet has formal upright growth and is the best substitute in the North for the California.

The European Privet is perhaps the hardiest and most beautiful of all Privets for hedges and for general planting, and is so considered by Prof. Sargent. The beautiful *terminal* clusters of fruit are jet black and shiny as though varnished and are very persistent hanging on until early spring. Until recently it has been a much neglected shrub but is fast becoming a favorite with the best Landscape Architects.
